

**Amendments to the Abstract:**

The Applicant submits the following abstract on a separate sheet:

--An industrial-strength scrim is made of thermoplastic tapes woven together in a twill weave, in which the weft tapes cross over at least two successive warp tapes and under at least one successive warp tape, in a repeating pattern. Such weave permits more tapes per inch to be accommodated in the scrim than for a plain weave, producing a scrim having greater mechanical strength, less cramming and folding of tapes and a smoother surface with fewer voids, suitable for coating.--

This "Abstract of the Disclosure" was taken from the Abstract published with the corresponding PCT patent application.
